The Observable page is where you can enter the type of observables that have been sighted throughout the event process.

We're going to select the observable type and keep in mind that multiple observables can be added to this page.

We'll just use the IPv4 address. From there, I'll add the observable value and then the times associated with that observable, such as when it was first observed. We'll select a time for that and the appropriate time zone; when was it last observed inappropriate time zone, and how many sightings have you seen so far.

You can also enter the observable relationship and how this is related to the Target or the attacker, and if you're not sure, you can enter unknown or is this benign; it's not related to either the Target or the attacker.

In this case, we're going to relate this to the attacker, and it's going to bring up the attacker that we created in the first slide. We can add it to the cart. Multiple observables can be entered on this page, so every time you add an observable to the cart, it will reset, and then you can add another observable from there and add it to your cart.
