Next is the TTP or technique, tactic, or procedure page. This is where you can align a TTP with an observable or with the event itself.

The first block is the designation or label. This is free text, so I'm going to label this TTP one.

The next two blocks are the tactic and the technique, and those align with the MITRE ATT&CK framework. You may know those already, and if you have those, you can enter them here, but most of us don't know them, so we can link to the CISA Decider Tool to help us with that. So we're going to hit the decider tool button. It's going to take me to CISA's decider tool page, and you can start answering questions that will help align your tactic and technique to what you've seen.

You have several cards, and as you select cards, you can get more detailed information, and ultimately you can add these cards to your cart.

At this point, I have one already added to my card, and I've named it IMX test and there are several options here, but I'm going to use the send IMX button.

It's going to ask me if I would like to return IMAX, and I do so, that's populated my tactic and technique number here, and if I want to align it to this observable, I can just highlight that and then add it to the cart.

After that, you can add multiple TTPs, as it's zeroed out the form, or you can continue.
