The next page explore weaknesses and vulnerabilities and it starts with a question, “Did the threat after exploit a weakness and are vulnerability that is bypassed or nonexistent?” If the answer is yes, it will activate the page.

Was there a control not implemented that resulted in the weakness? There may or may not be, but we're going to select control access. Remember these are all optional. Once it's highlighted it's selected.

If you'd like to reference a previously uploaded TTP, you can do so here. I'll access TTP1.

Was there an exploitation against a weakness? We have weaknesses loaded for you. We're going to say Improper Authentication.

Finally, was there a vulnerability that was exploited? These can be referenced by CVE number. Now most of us don't know these, and this link will take you outside of IMAX to the CISA CVE page, and you can explore those. There are multiples but I'm just going to copy this CVE number here and go right back into IMX and paste it into our CVE block. Yyou can see it's validated it so I'm going to add it to cart.

Like most pages, if you'd like to add multiples the form zeros out and you can add another. We're going to continue from here.
